

Case Organizer — Backend

What this is

API server for a legal case-note organizer.
Handles login and (soon) cases/notes.

Setup (do this on your own machine, not in chat)

1. **Install Node.js** if you don't have it:
<https://nodejs.org> (LTS version)
2. **Get a free PostgreSQL database.** Easiest option: <https://supabase.com>
 - Create a free project
 - In their dashboard, find "Connection string" (URI format) — copy it
3. **Install dependencies:**

```
cd backend
```

```
npm install
```

4. Set up your environment file:

```
cp .env.example .env
```

Open `.env` and paste in your real `DATABASE_URL` from Supabase. For `JWT_SECRET`, type any long random string (e.g. mash your keyboard).

5. Create the tables.

In Supabase, go to the SQL Editor, paste the contents of `db/schema.sql`, and run it.

6. Start the server:

```
npm run dev
```

You should see: `Server running on http://localhost:4000`

7. Test it works.

Using a tool like Postman, or even curl:

```
curl -X POST  
http://localhost:4000/api/auth/register \
```

```
-H "Content-Type:
application/json" \
-d
'{"email":"test@example.com","pass
word":"test1234"}'
```

You should get back a user object. If you do
— auth is working.

Next step

Once this runs and you understand what each
file does, come back and we'll
build the cases and notes endpoints together.
